

Workforce Exit Analysis

Retirement, resignation and layoff patterns across the workforce

Descriptive analysis based on the HR Analytics Power BI report and project notes

RETIREMENT

885

59.6% of all recorded exits

RESIGNATION

385

25.9% of all recorded exits

LAYOFF

215

14.5% of all recorded exits

Executive readout

Two distinct workforce signals emerge. Retirement is the largest recorded exit reason and clusters among older, long-tenured employees. Resignations skew younger and toward shorter tenure, especially in Customer Service. Layoffs are concentrated in Stores and appear in 2014-2015. These are evidence-based patterns, not proof of root causes.

1. Overall exit mix

Exit reason composition across 1,485 recorded exit cases

Recorded exit cases by reason

Interpretation

Retirement is the dominant recorded reason. The three counts reconcile exactly to 1,485. This describes the mix of exits; it is not an exit probability or turnover rate for any employee group.

Analytical rule

Keep exit volume, share of exit cases, and turnover rate separate. A large count can reflect a large workforce; a rate needs a time-matched workforce denominator.

2. Retirement: the largest exit pattern

885 retirement cases; older age profile and concentration in Stores departments

Retirement exits by department

Stores total: 817. Head Office: 68. Meats + Produce account for 623 cases (70.4% of all retirement exits; 76.3% of Stores retirement exits).

Department role maps

Meats: 298 Meat Cutters and 19 Meats Managers.
Produce: 289 Produce Clerks and 17 Produce Managers.

What this supports

Retirement creates a succession and knowledge-transfer planning signal, especially in Meats, Produce and selected operational roles. Role counts are exit counts, not role-specific retirement rates.

3. Head Office: broad retirement exposure

The retirement cohort aligns closely with an older, long-tenured Head Office profile

HEAD OFFICE IDS

80

Distinct employees in view

RETIREMENT EXITS

68

Across multiple departments

HEAD OFFICE AGE

61.74

Average age in workforce view

HEAD OFFICE TENURE

22.30 yrs

Average tenure in workforce view

Retirement department map (Head Office)

All 68 retirement exits were age 50+; tenure was 16-20 years for 32 and 21-25 years for 36. Average retirement age: 62.65; average retirement tenure: 21.78 years.

Workforce profile context

Age and service

The 68 retirements resemble the Head Office profile: age 62.65 vs 61.74; tenure 21.78 vs 22.30 years.

Hiring age

69 of 80 employees are shown in the 40-44 age-at-hire band. This is a profile

Role-level examples

HR Technology: 7 HRIS Analysts and 1 Director. Recruitment: all 8 exits were Recruiters. Validate role coverage and succession capacity before claiming service disruption.

4. Resignation: younger and shorter-tenure profile

385 resignation cases; a clear early-tenure pattern, led by Customer Service

Resignations by department

Top three departments: 297 of 385 resignations (77.1%). Customer Service alone: 179 (46.5%).

Age profile

Interpretation

292 resignations (75.8%) were ages 18-34. Age and tenure patterns support an early-career retention question; they do not identify the reason employees resigned.

5. Layoff: a different and more mixed profile

215 layoff cases; concentrated in Stores and visible in 2014-2015

Layoffs by age

Layoffs by experience

Gender composition

Female: 113 (52.6%). Male: 102 (47.4%). This is close to the overall workforce gender mix and does not by itself signal a gender-specific layoff pattern.

What we can and cannot say

Layoffs are not concentrated in a single age or tenure band. The year chart shows cases in 2014 and 2015, declining in 2015. Department/job breakdown and business context are still needed before explaining the pattern.

6. Department comparison

Different departments show different exit mixes; one generic retention action will not fit all

Department	Distinct workforce	Exits	Turnover rate	Largest recorded reason
Meats	1,252	377	43.09%	Retirement 317 (84.1%)
Produce	1,060	353	49.93%	Retirement 306 (86.7%)
Customer Service	1,190	262	28.23%	Resignation 179 (68.3%)
Dairy	1,033	191	22.68%	Retirement 81 (42.4%); resignation 64 (33.5%)
Bakery	898	112	14.25%	Retirement 61 (54.5%)
Processed Foods	736	90	13.93%	Resignation 54 (60.0%)

Retirement pattern

Meats and Produce lead in retirement exit volume and have high retirement shares among their recorded exits. Their large workforce sizes matter when interpreting counts.

Resignation pattern

Customer Service and Processed Foods have resignation-led exit mixes. Dairy has many resignations by count but a more mixed reason profile.

7. Recommendations and analytical limits

Action priorities for HR and the final portfolio story

- 01 Plan succession for retirement exposure** Map backup coverage and knowledge transfer for HRIS Analysts, Recruiters, Meat Cutters and Produce Clerks. Identify roles with a single incumbent or no ready successor.
- 02 Investigate early-tenure resignations** Prioritize Customer Service, then Processed Foods. Use structured exit and stay interviews to test onboarding, scheduling, workload, career path and compensation hypotheses; do not present any as proven causes.
- 03 Diagnose the layoff cluster** Break 2014-2015 layoffs down by department, job title and business unit. Compare with staffing plans and business changes before recommending workforce actions.
- 04 Report rates with matched denominators** Show exit counts and turnover rates separately. For department/job comparisons, use average headcount over the same period and same filters, not only distinct employee counts across the dataset.
- 05 Add controls and validation** State the observation window and filter context. Reconcile all reason counts to 1,485. Preserve the corrected age-at-termination calculation and exclude the superseded 666 figure.

Limitations and reporting note

This is a descriptive analysis of historical Power BI screenshots and project notes; no raw employee-level data was re-audited for this report. The dashboard shows snapshot years 2006-2015. Ratios such as 68 retirements / 80 Head Office IDs are cumulative screening comparisons, not annual retirement rates. The dataset does not establish why employees resigned or the operational impact of exits. Validate every displayed number against the model before external publication.
